

Casting kiln tyre manufacturer in China - CHAENG

Rotary kiln tyres will be affected by contact stress and bending stress during operation, and the surface will have flaky peeling and cracking. Therefore, the rotary kiln tyres must have sufficient resistance to contact stress and bending stress and have good wear resistance.

The advantages of CHAENG rotary kiln tyre:

1. CHAENG uses ZG45 and ZG42CrMO materials to ensure the strength and toughness of the rotary kiln tyre.
2. CHAENG uses CAE software digital simulation technology to assist in quality prediction and process optimization.
3. CHAENG adopts a dual-medium quenching process to treat the rotary kiln tyres so that the tyres have good wear resistance and can adapt to various harsh working environments.
4. We ensure the internal quality of the kiln tyre through non-destructive testing (NDT) and improve the surface quality with shot blasting equipment.
5. We ensure the internal quality of the kiln tyre through non-destructive testing (NDT) and improve the surface quality with shot blasting equipment.
